

premium hydraulic outboard steering, front mount cylinder

# SeaStar PRO<sup>®</sup>

## premium outboard steering

*SeaStar PRO — the  
Choice for High Speed  
Single Outboard Boats!*

High speed generates high torque loads.

High torque loads greatly increase your steering effort.

Hydraulic steering systems weren't generally used on high speed boats until the advent of SeaStar PRO.

In a traditional hydraulic system, the propeller feedback load will try to turn the steering wheel. Since hydraulic helms have lock valves, the wheel doesn't turn but pressure in that hydraulic line will increase as the pressure in the other line drops. When the wheel is turned *with* the load, there is a dead spot, which makes handling difficult in high speed boats.

SeaStar PRO changed all that and made this version of hydraulic steering the standard for high speed single outboard powered boats.

SeaStar PRO's unique valve system keeps pressures in the two hydraulic lines about equal, so the wheel feels solid and sure at all times.

SeaStar PRO is the only hydraulic steering system uniquely designed to give you maximum steering comfort and control of your high-performance bass boat.

SeaStar PRO has been installed on premium bass boats as original equipment for many years. It's the ideal upgrade for twin-cable mechanical steering.
